

Espresso Tracker

Terminal commands to run the full application

1 Start MySQL Database

Make sure MySQL is running on port **3307** (as configured in `application.properties`).

```
# Check if MySQL is running
mysql -u root -p -h 127.0.0.1 -P 3307

# If MySQL is not running via Homebrew:
brew services start mysql

# Verify the database exists (it will be auto-created if not):
mysql -u root -p -h 127.0.0.1 -P 3307 -e "SHOW DATABASES;"
```

The database `espresso_tracker` will be created automatically by Hibernate/Flyway when the backend starts.

2 Start the Spring Boot Backend

From the project root directory, run this Maven command:

```
# Navigate to project root (if not already there)
cd /Users/nima/My\ Codes/JaveSpring/Espresso-Tracker

# Start the backend on port 9090
mvn spring-boot:run

# Wait for output showing:
```

Tomcat started on port 9090 (http) with context path ''
Started TrackerApplication in 1.7 seconds

The backend will be available at **http://localhost:9090**. API endpoints are at **http://localhost:9090/api/v1/beans** and **http://localhost:9090/api/v1/brew-logs**.

3 Start the React Frontend

Open a **new terminal window** and run:

```
# Navigate to the frontend directory
cd /Users/nima/My\ Codes/JaveSpring/Espresso-Tracker/frontend

# Install dependencies (only needed once)
npm install

# Start the Vite dev server
npm run dev

# Wait for output showing:
VITE v8.1.3  ready in 116 ms
→ Local:   http://localhost:5173/
```

The frontend will be available at **http://localhost:5173**. The Vite dev server automatically proxies `/api/*` requests to the backend at **localhost:9090**.

4 Open the App & Verify

With both servers running, open the frontend in your browser:

```
# Open in default browser
open http://localhost:5173

# Or test the API directly via the proxy:
```

```
curl http://localhost:5173/api/v1/beans
```

```
# Expected response (empty array = no data yet):
```

```
{
  "content": [],
  "page": 0,
  "size": 20,
  "totalElements": 0,
  ...
}
```

Quick Reference

```
#
# | Backend:  mvn spring-boot:run
# | Frontend: cd frontend && npm run dev
# | Browser:  http://localhost:5173
#
```

Ports:

```
5173 → React frontend (Vite dev server)
9090 → Spring Boot backend
3307 → MySQL database
```

Pages:

```
/ → Dashboard (recent beans + top brews)
/beans → All beans (card grid)
/beans/new → Add a new bean
/beans/:id → Bean details + brew logs
/brew-log/new → Log a new espresso extraction
```

API Endpoints (proxied via Vite):

```
GET    /api/v1/beans → List all beans
POST   /api/v1/beans → Create a bean
GET    /api/v1/beans/{id} → Get bean by ID
```

```
PUT    /api/v1/beans/{id}    → Update a bean
DELETE /api/v1/beans/{id}    → Delete a bean
POST   /api/v1/brew-logs     → Log a brew
GET    /api/v1/brew-logs/bean/{id} → Logs for a bean
```
